Pillar One Amount A Formula

Jurisdiction J's Net Tax Revenue Gain/Loss = (A * B) * [(C * D) – (E * F)] (1)

Source: OECD Economic Impact Assessment (Oct. 12, 2020, page 29).

Simple Analytics of the Amount A Formula

> Jurisdiction J's Net Revenue Tax Gain/Loss =

(A * B) * [(C * D) - (E * F)] (1)

- In equation (1), components A and B in the formula are global numbers that are identical for all tax jurisdictions.
- > C, D, E, and F are jurisdiction-specific variables that vary for each jurisdiction depending on its roles as a
 - > Market jurisdiction (C x D)
 - > Residence and/or Source jurisdiction (E x F).

Insight #1: Raising/Lowering A or B Raises/Lowers Amount A

J's Net Tax Revenue Gain/Loss = (A*B) * [(C*D) – (E*F)]

In-Scope? Global Profit? Residual Profit Threshold? Allocation Percent?

Source: OECD *Economic Impact Assessment* (Oct. 12, 2020, page 29).

Winners and Losers from Amount A (EIA, 2020)

Source: OECD Economic Impact Assessment (Oct. 12, 2020, page 61).

Winners & Losers from Amount A (EIA 2020)

Source: OECD Economic Impact Assessment (Oct. 12, 2020, page 62).

Insight #2: C- E Gap Matters Most

Assume J's CIT rate (component D) on "received" tax base is the same rate (component F) that J provides on "relieved" tax base so D = F = t, equation (1) becomes:

Whether J gains or loses from Amount A depends on its C-E gap; that is, its share of GIDS relative to its share of GRIP. To determine who wins/loses from Amount A, look at the sign and size of the jurisdiction's C – E gap.

Insight #3: Amount A = Sales-Based Global Formulary Apportionment

To estimate the dollar value of the gain or loss in each jurisdiction's corporate income tax (CIT) base under Amount A, I rewrite Component C as "S/ Σ S" where " Σ S" is GIDS, and Component E as "P/ Σ P" where " Σ P" is GRIP. Amount A now is:

- Net gain/loss in J's CIT revenues = t * [$B * S (\Sigma P / \Sigma S P / S)$]
- The greater the **deviation of J's ROS from the world average ROS**, the larger (in absolute value terms) is J's tax base gain or loss.
- Winners: stagnant economies (low P/S) are tax base receiving.
- **Losers: dynamic jurisdictions (high P/S)** are tax base relieving.
- Large winners are countries where S is large but no nexus (no PE) so profits are recorded elsewhere (e.g., ADS).
- Large losers are jurisdictions with very high profits relative to in-country sales so P/S approaches infinity. Even where S is low, these jurisdictions (e.g., investment hubs) are likely targets to provide tax base relief under Amount A.

Example 1: Winners/Losers Investment Hubs (USD Billion)

	Jurisdiction Group	Com-	Component E	& Thresholds	(C - E) Gap & Thresholds

Insight 4A: Pillar One Tax Games - Multinationals

An MNE can affect its global CIT taxes paid under Amount A, by :

- Being excluded from Pillar One by <u>not being in-scope</u> (finance & insurance, extractive industries, state owned multinationals).
- <u>Reducing the amount of its GRIP</u> (global residual in-scope profit) in Tax Base Relieving Jurisdictions (C < E)
 - Reducing its residual profit by raising its routine profit (affects RPT)
 - Shifting its business lines into out-of-scope activities (definition of "inscope" and activity tests)
 - Change mode of entry if doing so reduces GRIP
- <u>Reducing its share of GIDS</u> (global in-scope destination-based sales) in Tax Base Receiving Jurisdictions (C > E)
 - Change the Mode of Entry (e.g., wholly owned vs franchise) or where sales are booked (e.g., regional marketing hub) if doing so reduces GIDS
 - Shift out of Market jurisdictions where GIDS is low and not likely to grow
- Note: Transfer pricing would still be driven by tax differentials → MNE's goal is to maximize worldwide profits after tax.

Insight #4B: Pillar One Tax Games - Governments

J's Tax Base Change = [A * B] * [(C*D) - (E*F)]Assuming D = F = t then

➢ J gains tax base if C > E (tax base receiving)
 → J's Goal: maximize its tax base gains from Amount A

➢ J loses tax base if C < E (tax base relieving)
 ➔ J's Goal: minimize its tax base losses from Amount A

Pillar One Tax Games: Governments

J's Tax Base Change = A * B * [C * D - E * F]

J can affect the size of its gain from Amount A by:

- Increasing its share of GIDS (component C)
 - Playing with definitions: G + I + D + S
- Reducing its share of GRIP (component E)
 - Playing with definitions: G + R + I + P
 - No nexus so E = 0 (no Perm Est, Commissionaires, ADS sales)
- Tax rates (components D and F)
 - Setting a higher tax rate on "found" tax base than on "lost" tax base (D > F)
 - Refusal to provide tax relief on its share of GRIP that has been reallocated to Market jurisdictions (sets F = zero)

→ Who provides tax base relief matters!

Tax Base Receiving → Who Provides Tax Base Relief?

OECD. Oct 2021. Two-Pillar Solution to Address the Tax Challenges Arising from the Digitalisation of the Economy, page14.

Insight #5: Who are the "Tax Relieving" Jurisdictions?

Source: OECD *Pillar One Blueprint (*Oct. 12, 2020, Chapter 7, pp. 139-159 and 227-230). Four-Step Tax-Relieving Process

- 1. <u>Activities</u> entities performing nonroutine activities that make material and sustained contribution to the group's ability to generate residual profit (i.e., functions/assets/risks & DEMPE).
- 2. <u>Profitability</u> exclude entities that make only routine profits or losses
- **3.** <u>Market Connection Priority</u> activities should be connected to the market jurisdiction
- 4. <u>Back-Stop (Pro-Rata Allocation)</u> Last resort: allocate tax liability among group entities pro-rata until entity earns only routine profits. (waterfall?)
- ➢ Four-step process → Tax Base Relief provided by Residence and Source jurisdictions with MNE Parents, Principals & Full-Fledged Entities. What about investment hubs and tax havens?
- Fuzziness of four-step process encourages Pillar One Tax Games ("Pass the Buck", "I Can't Pay the Rent").
- > Decentralized MNEs encourage Tax Games by both MNEs & Governments.

Scenario #3 (full tax games)

Who receives?

J1, J2, J3, J4 (2 LRDs & 2 FFDs)

Who pays?

H, J1 and J3 should pay but choose not to

Who doesn't have to pay?

J2 and J4 (2 LRDS)

Who does netting-off? H, J1 and J3 should but choose not to

Winners: J1-J4 (all gain tax revenue) Losers: none

No Change: H (parent)

NET IMPACT: MNE GLOBAL TAX BASE RISES BY AMOUNT A.

"Who Pays the Rent?" Pillar One Tax Games

> Amount A ignores Territorial Tax Systems

- > Residence Jurisdictions exempt Foreign Source Income from outward FDI. ("I already paid the rent!")
- > Source countries receive CIT Base the FSI earned by foreign MNEs abroad (inward FDI).
- Source Jurisdictions with high-profit foreign MNEs (e.g., US MOFAs in Europe) won't give up tax base and want to tax foreign MNEs ("I won't pay the rent!")
- Large players engage in tit-for-tat retaliation. ("If you won't pay the rent, I won't pay the rent!")
- > Prospect Theory → Source countries already taxing foreign MNEs giving up tax base is more costly than receiving ("I can't lose the rent!").
- > **Small jurisdictions get side swiped** ("We never get the rent!").

"Who Pays the Rent?" Pillar One Tax Games

- > OECD's proposed solution (Oct 2021)? New Multilateral Convention (MLC) with Mandatory Binding Arbitration (MBA) run by an Omniscient Benevolent Dictator (OBD) → MLC + MBA + OBM = "My Hero!"
- > Reality \rightarrow
- > Two-layer system: existing Intl Tax Regime + Pillar One → double taxation.
- MNEs will pay the rent in higher worldwide taxes. With FIN/INS, Nat Resources & State-owned MNEs out, majority of costs fall on US MNEs in ADS and Manufacturing sectors.
- > There are better ways to tax MNEs in the digital economy.
